# One Stop For Wood Pelleting Plant Layout-Design-Installation

Energy Unlimited Inc started with the wood pelleting industry before there really was a wood pellet industry. In the late 80's Energy Unlimited Inc was providing dryers and burners for the wood shavings industry mostly animal bedding for equine and poultry. While installing the burners and drying systems a steady stream of questions started to arise from sawmills looking to do something with their waste products. With a combination of research and hands on trial and error the first Energy Unlimited Inc designed wood pellet plant was born in MT Hope WV for the Jim C Hamer Company. 20 years later not only are they still in business Energy Unlimited Inc has done several upgrades and additional drying systems for this customer.

## Experience

Energy Unlimited Inc has continually expanded on its designs and fabrications to offer both quality and economical value to all its systems from a simple burner install to a ground up Greenfield design build.

While many companies jump on the pellet plant design bandwagon as a way to either supplement their main business, like a down turn in the lumber industry, or maybe they operated a pellet plant somewhere, they usually lack the big picture knowledge of having done successful installs in different geographical regions.

Unlike a lot of companies Energy Unlimited Inc will tell you “wood is not wood” and every wood pellet is not created equal.
